Upper & lower ventilation

Upper ventilation

Lower ventilation

Our newest development is self-ventilating wine coolers. This makes the wine coolers extremely easy to install as the vents usually required to create the airflow are no longer needed. There is a ventilation grille at the bottom of the cooler which allows the cool air to reach the compressor, at the top there is another ventilation grille which allows the warm air to escape. This means that integrated units can now be installed underneath worktops making them extremely easy to incorporate into modern kitchens.

The installation is much simpler than standard integrated models as they simply slide into a housing. There is no need for grilles in the plinth or ventilation to the rear and all are suitable for installation under a worktop.
